

NEW HORIZON
COLLEGE OF ENGINEERING

AUTONOMOUS COLLEGE Permanently Affiliated to VTU. Approved by AICTE & UGC
Accredited by NAAC with 'A' Grade

Department of Electronics and Communication Engineering

15.04.2019

EXPERT LECTURE

The students of IV semester ECE department are hereby informed that the **Expert Lecture** is scheduled on

“DSP Processor and Digital Filters”

On 16.04.2019

By

**Mr. Sarang Suresh Akotkar, Deep learning R& D Engineer,
Mr. Kumaran Sethuraman, Deep learning R& D Engineer,
Intel Technology Pvt Ltd, Bengaluru, India.**

S. No	Timings	Semester
1	10.30 AM – 12.30 PM	4 th (A, B & C)

Venue: MBA seminar hall

Note: All the Faculty members are invited to attend the same.

Faculty In charge:

1. Dr. Jayanthi *MJ*
2. Ms. Ishani Mishra *Jais*
3. Ms. Thanuja *SP*

[Signature]
HoD/ECE

Kumaran Sethuraman

Profile Summary : Delivered excellent contributions towards multiple product delivery include Android based Intel Mobile Phones, Tablets. Recent years focused on Speech, Audio Visual Neural Networks, Fusion methods, Deep Learning, Deep learning hardware accelerators..

Education : M.Tech

Area of Excellence Include:

- Multimodal Deep learning system using Audio Visual modality
- Machine Learning

Professional Experience:

17 years of experience in the field of DSP algorithms and complete audio stack development and Machine learning. Expertise in system analysis and performance optimization for real time audio software across platforms.

Additional Skills:

- Excellent in Neural networking tool.
- Have done Research on and created the end to end Audio Visual Speech Recognition system

REPORT ON GUEST LECTURE

23^A
~DIGITAL SIGNAL PROCESSING AND REAL TIME
APPLICATION IN INDUSTRY

Content delivered by:

Mr. Sarang Suresh Akotkar & Mr. Kumaran Sethuraman
Date: 16/04/2019

The expert lecture for DSP was held on 16 April 2019 at the MBA seminar hall from 10.30 to 12.30 pm. We had two industry experts from Intel technologies Mr. Sarang Suresh Akotkar and Mr. Kumaran Sethuraman.

They highlighted how DSP manipulates different types of signals with the intention of filtering, measuring, or compressing and producing analog signals. Some of the key points noted from the session were:

1. A Digital Signal Processor contains four key components:

- Computing Engine: Mathematical manipulations, calculations, and processes by accessing the program, or task, from the Program Memory and the information stored in the Data Memory.
- Data Memory: This stores the information to be processed and works hand in hand with program memory.
- Program Memory: This stores the programs, or tasks, that the DSP will use to process, compress, or manipulate data.
- I/O: This can be used for various things, depending on the field DSP is being used for, i.e. external ports, serial ports, timers, and connecting to the outside world.

2. Some of the DSP Filters:

- **IIR Filters** (infinite impulse response filter)-IIR filters are typically designed basing on continuous-time transfer functions. IIR filters differ from FIR filters because they always contain feedback elements in the circuit, which can make the transfer functions more complicated to work with.
- **FIR Filters**- FIR filters are specific to sampled systems. There is no equivalent in continuous-time systems. Therefore, only very specific analog filters are capable of implementing an FIR filter.

3. Fixed Point vs Floating Point

Digital signal processing can be separated into two categories - fixed point and floating point. These designations refer to the format used to store and manipulate numeric representations of data. Fixed-point DSPs are designed to represent and manipulate integers – positive and negative whole numbers – via a minimum of 16 bits, yielding up to 65,536 possible bit patterns (2^{16}). Floating-point DSPs represent and manipulate rational numbers via a minimum of 32 bits in a manner similar to scientific notation, where a number is represented with a mantissa and an exponent (e.g., $A \times 2^B$, where 'A' is the mantissa and 'B' is the exponent), yielding up to 4,294,967,296 possible bit patterns (2^{32}).

4. Applications of DSP:

- Audio signal processing, audio compression
- digital image processing

- video compression, speech processing, speech recognition
- digital communications, digital synthesizers, radar, sonar, financial signal processing, seismology and biomedicine.

Feedback:

It was very interactive session, well related to the academics and well delivered. Understood the application of Digital Signal Processing in Real time applications and what industry people expect from young engineers like us.
